# The Algorithm

```
1  for each file F in FILES
2      for each word W in F
3          if W does not exist in TST
4              create an empty array A of size 11
5              A[10].filename = F.filename
6              A[10].frequency++
7          else
8              if A[10].filename == F.filename
9                  A[10].frequency++
10             else
11                 sort array A
12                 A[10].filename = F.filename
13                 A[10].frequency++
14
15  for each word W in TST
16      get array A of W
17      sort A
18      put array A
19
20  |
```

For each word  
in TST, sort

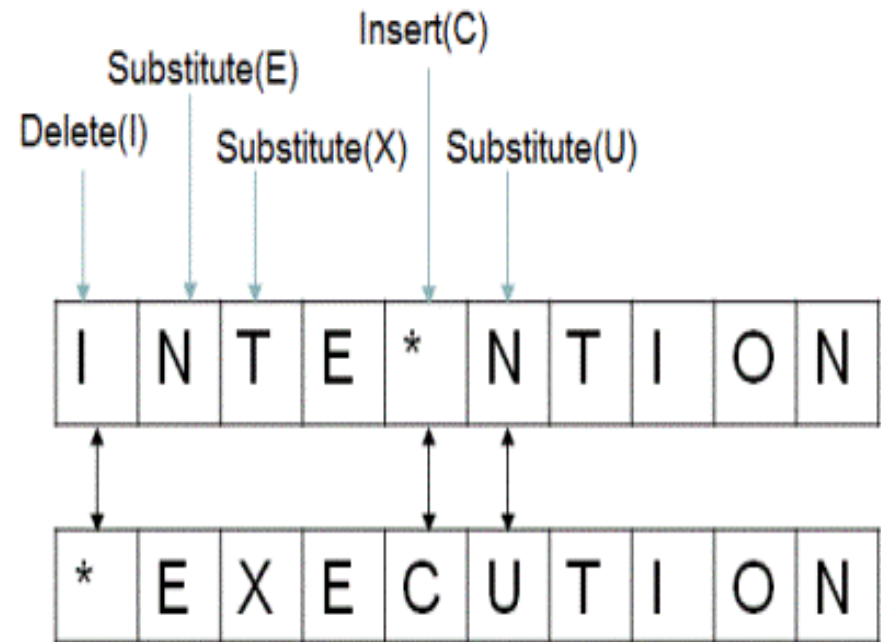

# Edit Distance

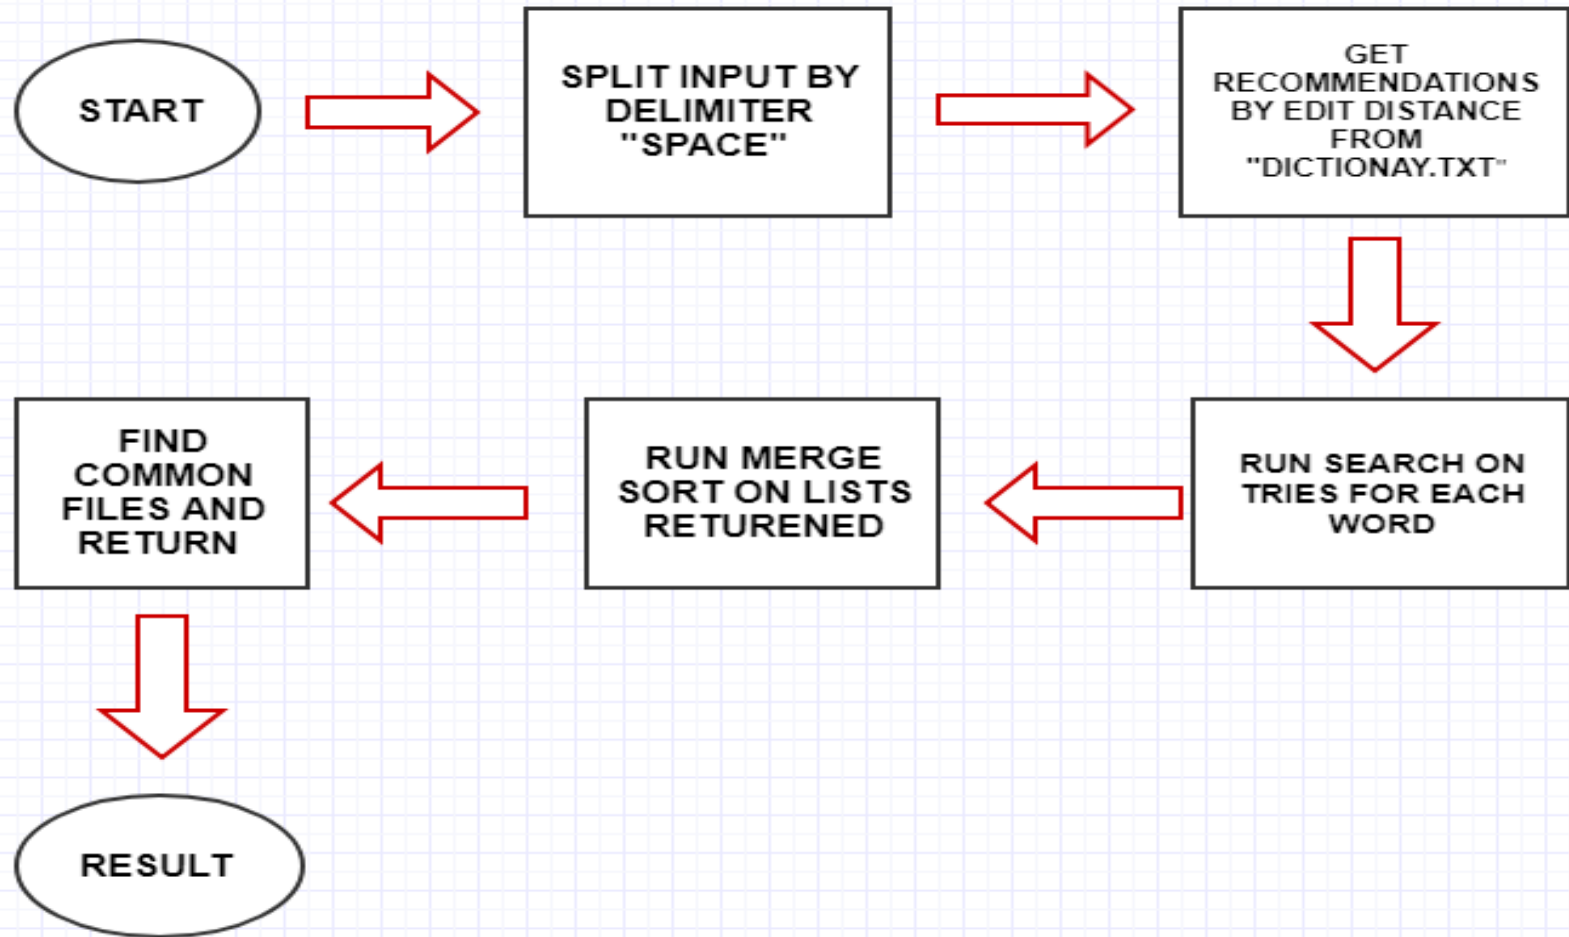

- ❖ The Edit Distance is defined as the minimum number of edits needed to transform one string into the other.
- ❖ Given an **initial string s**, and a **target string t**.

The list of valid changes are:

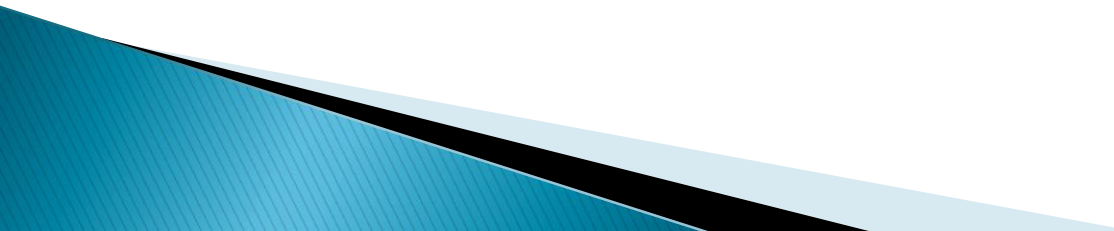

- 1) Inserting a character
- 2) Deleting a character
- 3) Changing a character to another character.

# OVERVIEW

# Concepts Used

- ▶ Regular Expression
  - ▶ Ternary search trie(TST)
  - ▶ Merge Sort
  - ▶ Edit Distance
-
